

My implementation should be fully compatible with the original image:

- Running the handler in the file specified by pyfile.yaml configMap
- Using REDIS_HOST and REDIS_PORT to connect to redis
- Using REDIS_INPUT_KEY and REDIS_OUTPUT_KEY to get and set the values in redis database

Additionally, I added a environment variable called USER_MODULE_FILE_PATH (defaults to /opt/usermodule.py) for local testing purpose, so I can run the runtime without using Docker.
